

Compiling with g++

Difficulty Level : Basic • Last Updated : 27 Dec, 2020

[Read](#)[Discuss](#)[Courses](#)[Practice](#)[Video](#)

g++ command is a GNU c++ compiler invocation command, which is used for preprocessing, compilation, assembly and linking of source code to generate an executable file. The different "options" of g++ command allow us to stop this process at the intermediate stage.

- **Check g++ compiler version information:**

```
g++ --version
```

```
ak@ubuntu:~$ g++ --version
g++ (Ubuntu 6.3.0-12ubuntu2) 6.3.0 20170406
Copyright (C) 2016 Free Software Foundation, Inc.
This is free software; see the source for copying conditions. There is NO
warranty; not even for MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE.
```

Compile a CPP file to generate executable target file: `g++ file_name` command is used to compile and create an executable file `a.out` (default target name).

CPP

AD

```
// hello.cpp file
#include <iostream>
int main()
{
    std::cout << "Hello Geek\n";
    return 0;
}
```

```
g++ hello.cpp
```

```
ak@ubuntu:~$ g++ hello.cpp
```

Start Your Coding Journey Now!

present working directory and **a.out** is the executable target file.

```
./a.out
```

```
ak@ubuntu:~$ ./a.out  
Hello Geek
```

- **g++ -S file_name** is used to only compile the **file_name** and **not** assembling or linking. It will generate a **file_name.s** assembly source file.

Example:

```
g++ -S hello.cpp
```

- **g++ -c file_name** is used to only compile and assemble the **file_name** and **not** link the object code to produce executable file. It will generate a **file_name.o** object code file in present working directory.

Example:

```
g++ -c hello.cpp
```

Start Your Coding Journey Now!

- **g++ -o target_name file_name:** Compiles and links **file_name** and generates executable target file with **target_name** (or a.out by default).

Example:

```
g++ -o main.exe hello.cpp
```

```
ak@ubuntu:~$ g++ -o main.exe hello.cpp
ak@ubuntu:~$ ./main.exe
Hello Geek
```

- **Compile and link multiple files:** When **-c** flag is used, it invokes the compiler stage which translates source code to object code. When **-o** flag is used it links object code to create the executable file from **file_name.o** to **a.out(default)**, multiples files may be passed together as arguments.

Example:

CPP

```
// hello.cpp file
#include "helloWorld.h"
#include <iostream>
int main()
{
    std::cout << "Hello Geek\n";
    helloWorld();
}
```

Start Your Coding Journey Now!

CPP

```
// helloWorld.cpp file
#include <iostream>
void helloWorld()
{
    std::cout << "Hello World\n";
}
```

CPP

```
// helloWorld.h file
void helloWorld();
```

```
g++ -c helloWorld.cpp hello.cpp
```

- It compiles and creates object code for the files helloWorld.cpp and hello.cpp to helloWorld.o and hello.o respectively.

```
g++ -o main.exe helloWorld.o hello.o
```

- It links the object codes helloWorld.o and hello.o to create an executable file main.exe

```
./main.exe
```

- It runs the executable file main.exe

Start Your Coding Journey Now!

```
ak@ubuntu:~$ g++ -c helloWorld.cpp hello.cpp
ak@ubuntu:~$ g++ -o main.exe helloWorld.o hello.o
ak@ubuntu:~$ ./main.exe
Hello Geek
Hello World
```

- **g++ -Wall file_name:** It prints all warning messages that are generated during compilation of **file_name**.

Example:

C++

```
// hello.cpp file
#include <iostream>
int main()
{
    int i;
    std::cout << "Hello Geek\n";
    return 0;
}
```

```
g++ -Wall hello.cpp
```

- File extension for c++ files can be .cpp or .c++ , .cpp is widely used but .cpp and .c++ are exactly same and all above functionalities are same for .c++ too

Start Your Coding Journey Now!

```
2 using namespace std;  
3 int main()  
4 {  
5     cout<<"GeeksForGeeks"<<endl;  
6     return 0;  
}
```

TERMINAL

```
> > v TERMINAL  
PS F:\Imporevent> g++ .\main.cpp -o .\main.exe  
PS F:\Imporevent> .\main.exe  
GeeksForGeeks  
PS F:\Imporevent> |
```
